

Abstract

A data generating device for use with a coin mechanism of a bulk vending machine, is provided. In all of the embodiments, the invention uses a standard coin mechanism of a bulk vending machine, which in its normal operation is received into an opening in the bulk vending machine, and a data generating device in working relation with the coin mechanism. The data generating device, will be able to receive, store and generate various types of information relevant to owners/operators of bulk vending machines, including but not limited to, day and/or time of particular vends, particular machine from which the vend took place, particular location/owner/operator of machine from which each vend originated, and the identity of the person collecting the money from the machine, while also allowing for the multiple hook-up of numerous data generating devices positioned on numerous machines found in one location so as to achieve a report on all vends from all machines.
